Altis Talent Acquisition Team
Altis
Canberra, Australian Capital Territory

Dear Altis Talent Acquisition Team,

I am applying for the Senior Consultant — Data Engineer role in Canberra. What drew me to it specifically is the brief to own engagements end to end — discovery through delivery — rather than hand off a design to someone else's build: that is the shape of the data engineering work I already do at Accenture, and I would rather keep doing it inside a firm built around exactly that model.

Altis being technology-agnostic matters to me for a practical reason, not an abstract one: on every engagement I have led, the right architecture only became clear after I understood what the client actually needed the data to do, not which platform was on the table. At Accenture I have built on Postgres, pgvector, Azure and GCP depending on what the problem called for, and walked clients through why — which is the same client-outcomes-first posture this role asks for rather than a vendor-first one.

Three things I would bring to this role. First, end-to-end delivery ownership: I designed and built a data pipeline for a national energy retailer — storage, embedding, hybrid retrieval — working directly with their compliance team to get the requirement right, which cut their regulatory review time from days to minutes. Second, people leadership: I currently lead 3 analysts on a Defence engagement and have mentored research students and 115+ medical students as a university lecturer, so developing a team alongside delivering is not new ground. Third, judgement under ambiguity at a level most data engineers are not tested on: my PhD involved statistical inference across 50M+ noisy observations with no clean answer available, which is the same muscle as scoping a client's actual problem before architecting a solution.

I am Canberra-based already, hold an NV1 security clearance, and am ready for the hybrid arrangement this role describes. I would welcome the chance to discuss how this background fits the Data & Analytics team you are building. Thank you for your consideration.

Sincerely,

Adrian Cioanca
