Altis Talent Acquisition Team
Altis
Canberra, Australian Capital Territory

Dear Altis Talent Acquisition Team,

I am applying for the Senior Consultant – Data Engineer role in Canberra. What pulled me toward it specifically is the brief to own engagements end to end, discovery through delivery, rather than hand a design off to someone else's build.

Why Altis

- I care that Altis is technology-agnostic because I have lived the alternative. At Accenture I have built on Postgres, pgvector, Azure and GCP depending on what the problem actually needed, and earlier, in my PhD, choosing a statistical method because it fit the data, not because it was the one I already knew, was the difference between a finding that held up under peer review and one that didn't. I want to keep making that call on the client's terms, not a platform's.
- Owning an engagement from discovery through delivery is a habit I already trust myself with. I ran a 7-person research team the same way, setting the question, choosing the method, and staying accountable for what came out the other end, and I would rather bring that habit to a firm built around it than adapt it to one that isn't.

What I bring

- I design for the outcome a client actually needs, not just the brief as written. At Accenture I built a data pipeline for a national energy retailer, working directly with their compliance team to get the requirement right, and cut their regulatory review time from days to minutes.
- Developing a team alongside delivering is not new ground for me. I currently lead 3 analysts on a Defence engagement, and before that I mentored research students and lectured more than 115 medical students, so I know what it takes to bring people along while the work is still moving.
- The judgement a senior consultant needs under ambiguity is the same one I built running statistical inference across 50M+ noisy observations with no clean answer waiting at the end. Scoping a client's actual problem before I touch the architecture is the same discipline, just with a different dataset.

I am Canberra-based already, hold an NV1 security clearance, and am ready for the hybrid arrangement this role describes. I would welcome the chance to discuss how this background fits the Data & Analytics team you are building. Thank you for your consideration.

Sincerely,

Adrian Cioanca
