Altis Talent Acquisition Team
Altis
Canberra, Australian Capital Territory

Dear Altis Talent Acquisition Team,

I am applying for the Senior Consultant – Data Engineer role in Canberra. A short version of how I got here: I finished my PhD with the Frank Fenner Medal, awarded to one PhD out of a cohort of 103 at the John Curtin School of Medical Research, then led a 7-person team that went on to publish 25 papers together. The part I actually enjoyed most was not the publication count, it was the team itself, coordinating 20 research groups across 7 universities toward one result. Working directly with industry changed things again. Delivering a preclinical model for Merck & Co. and a programme for Beta Therapeutics, I enjoyed it even more, using data and a bit of creativity to solve a real problem for a client with a business outcome attached to it, not just a publication. That is when I realised I wanted to do consulting properly, so I moved to Accenture to work with bigger clients on bigger problems.

Why Altis

- I care that Altis is technology-agnostic because I have lived the alternative. At Accenture I have built on Postgres, pgvector, Azure and GCP depending on what the problem actually needed, not what was being sold, and I want to keep making that call on the client's terms.
- Owning an engagement from discovery through delivery is exactly the habit the story above describes: set the question, choose the method, stay accountable for what comes out the other end. I would rather bring that habit to a firm built around it than adapt it to one that isn't.

What I bring

- I design for the outcome a client actually needs, not just the brief as written. At Accenture I built a data pipeline for a national energy retailer, leading a 3-person team and working directly with their compliance team to get the requirement right, cutting their regulatory review time from days to minutes.
- The judgement a senior consultant needs under ambiguity is the same one I built running statistical inference across 50M+ noisy observations with no clean answer waiting at the end. Scoping a client's actual problem before I touch the architecture is the same discipline, just with a different dataset.

I am Canberra-based already, hold an NV1 security clearance, and am ready for the hybrid arrangement this role describes. I would welcome the chance to discuss how this background fits the Data & Analytics team you are building. Thank you for your consideration.

Sincerely,

Adrian Cioanca
